Filters are designed to trap various kinds of debris, dirt and organic particles that will otherwise enter your plumbing system, restrict your water flow and create a breeding ground for bacteria. The first line of defense for residential and light commercial facilities located in and around rural areas where the source of water may be ponds, wells or streams that have high exposure to contamination from airborne pollutants, surface run-off, agricultural or industrial waste or similar dangers. The first step in achieving clean water is to install a primary filtration device, that effectively removes particulate matter and similar debris. A Triangular Wave Technologies sediment filtration device effectively removes sediments and water-borne pollutants ranging from herbicides and pesticides to iron and manganese. TWT recommends its use in all residential and light commercial applications.

**Note:**

Our 20 Micron Sediment Filter and Housing Unit can be placed in a pre-filter and/or post filter configuration. Periodically check to make sure the filter is free flowing, if the filter becomes fouled or clogged due to high sediment, replace filter.

20 Micron Replacement Sediment Filter
